

56

Name: Lianhan Huang 3700459; Qu Wang 3700666

## Task 1

## 1.1

 $X = \{\text{color, shape, texture}\}$  $Y = \{\text{banana, grapes, apple, orange}\}$ 

$D = \{\text{banana: [yellow, curved, smooth]; apple: [red, round, smooth]; orange: [orange, round, rough]; banana: [brown, curved, smooth]; grapes: [green, oval, smooth]; apple: [green, round, smooth]}\}$

## 1.2

Distance between  $l_0, l_1$  is  $|0-1|=1$ Distance between  $l_0, l_2$  is  $|0-2|=2$ Distance between  $l_0, l_3$  is  $|0-3|=3$ Distance between  $l_1, l_2$  is  $|1-2|=1$ Distance between  $l_1, l_3$  is  $|1-3|=2$ Distance between  $l_2, l_3$  is  $|2-3|=1$ 

Problem: distance not evenly distributed. Mis-classify  $l_1$  to  $l_3$  should not be more wrong than classify  $l_1$  to  $l_2$ .

Euclidean distance

## 1.3

True labels  $y = \{0, 2, 3, 0, 1, 2\}$ Predict labels by classifier  $\hat{y} = \{0, 2, 3, 3, 1, 1\}$ Loss =  $0+0+0+3+0+1 = 4$ 

Square Loss = 10

Euclidean distance

\*\* Q: what should the loss function be like?

## 1.4

To be uniform means to have equal distance between each pair of labels. Since in two-dimension coordinate system, the max number of uniformed labels is 3, we need three dimension.

 $L_0 = (1, 1, 1)$  $L_1 = (1, -1, -1)$  $L_2 = (-1, 1, -1)$  $L_3 = (-1, -1, 1)$ Distance =  $8^{**}0.5$  $L_0 = (1, 0, 0, 0)$  $L_1 = (0, 1, 0, 0)$  $L_2 = (0, 0, 1, 0)$  $L_3 = (0, 0, 0, 1)$ 

One hot encoding

Normalization:

Euclidean Distance:  $D = 2^{**}0.5$  $L_0 = (\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2})$  $L_1 = (\frac{\sqrt{2}}{2}, \frac{-\sqrt{2}}{2}, \frac{-\sqrt{2}}{2})$  $L_2 = (\frac{-\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \frac{-\sqrt{2}}{2})$  $L_3 = (\frac{-\sqrt{2}}{2}, \frac{-\sqrt{2}}{2}, \frac{\sqrt{2}}{2})$ 

## 1.5

Distance = 1

Loss =  $0+0+0+1+0+1=2$ 

L = 4

## 1.6

To encode all the features, for each feature, the distance should be the same, so:

Color: [yellow, red, orange, brown, green]

Yellow =  $(1, 1, 1, 1)$ Red =  $(1, -1, -1, -1)$ Orange =  $(-1, 1, -1, -1)$ Brown =  $(-1, -1, 1, -1)$ 

ONE HOT CODING

Green=(-1,-1,-1,1)  
 Shape: [curved, round, oval]  
     Curved=(1,1)  
     Round=(1,-1)  
     Oval=(-1,1)  
 Texture: [smooth, rough]  
     Smooth=(1)  
     Rough=(-1)

\*\* Q: do we need normalize all these values?

## Task2

### 2.1.1

F1-score is harmonic mean of recall and precious.

Precious: in true class i, how many samples are successfully counted.

$$\text{Precious} = \frac{T_{\text{positive}}}{(T_{\text{positive}} + T_{\text{negative}})}$$

Recall: in predicted class i, how many prediction is right.

$$\text{Recall} = \frac{T_{\text{positive}}}{(T_{\text{positive}} + F_{\text{positive}})}$$

$$\text{F1-score} = \frac{2 * \text{precious} * \text{recall}}{(\text{precious} + \text{recall})}$$

So:

Minimal F1-score = 0

When a classifier predict all instance as negative, but there is actually instance positive.

Maximal F1-score = 1

When the classifier perfectly predict all instance.

Precious: all true true in all true samples

Recall: all true true in all predicted samples

$$r = R * \cos(\theta) \quad p = R * \sin(\theta)$$

-> Use  $T_{\text{positive/negative}}$  and  $F_{\text{positive/negative}}$  to replace r and p

### 2.1.2

Pre = Recall = 0 means the classifier predict all instance in True\_class1 as class2, and all instance in True\_class2 as class1.

Hint: another formula of F1 score without using precision and recall

### 2.1.3

In data set  $D$  with  $n$  samples, the number of positive sample is  $m$ , negative sample is  $n-m$ .

If classifier pick class randomly:

$$\text{True\_Positive} = \frac{m}{2}, \text{True\_Negative} = \frac{(n-m)}{2}$$

$$\text{False\_positive} = \frac{m}{2}, \text{False\_negative} = \frac{(n-m)}{2}$$

ONLY CARE ABOUT TRUE

$$\text{Precious} = \frac{0.5m}{0.5n} = \frac{m}{n}$$

$$\text{Recall} = \frac{0.5m}{m} = 0.5$$

$$\text{F1} = \frac{2m}{(2m+n)}$$

If  $n-m = m$ :

$$\text{Precious} = 0.5$$

$$\text{Recall} = 0.5$$

$$\text{F1} = 0.5$$

### 2.2.1

For C1:  $P1=250/250=1$ ,  $P2=250/250=1$ ;  $R1=250/250=1$ ,  $R2=250/250=1$  ->  $F=1$

For C2:  $P1=125/250=0,5$ ;  $P2=125/250=0,5$ ;  $R1=125/250=0,5$ ;  $R2=125/250=0,5$  ->  $F=0,5$

Choose C1

### 2.2.2

For C1:  $P1=0$ ,  $P2=0$ ;  $R1=0$ ,  $R2=0$  ->  $F=0$

For C2:  $P1=125/250=0,5$ ;  $P2=125/250=0,5$ ;  $R1=125/250=0,5$ ;  $R2=125/250=0,5$  ->  $F=0,5$

Choose C2

C1

### 2.2.3

For C1:  $P1=200/225=0,89$ ,  $P2=200/275=0,73$ ;  $R1=200/275=0,73$ ,  $R2=200/225=0,89$  ->  $F=0,8$

For C2:  $P1=200/275=0,73$ ;  $P2=200/225=0,89$ ;  $R1=200/225=0,89$ ;  $R2=200/275=0,73$  ->  $F=0,8$

Choose C2, because higher true positive prediction matters more.

### 2.2.4

Choose C1, because lower false positive prediction matters.

C2

## Task3

### 3.1

Predict

	Apple	Grapes	Orange	Total
Apple	5	1	2	8
Grapes	1	7	1	9
Orange	1	1	6	8
Total	7	9	9	25

### 3.2

	Precious	Recall	F1
Apple	$5/7=0,71$	$5/8=0,625$	$0,8875/1,335 \approx 0.665$
Grapes	$7/9=0,78$	$7/9=0,78$	$1,2168/1,56 \approx 0.78$
Orange	$6/9=0,67$	$6/8=0,75$	$1,005/1,42 \approx 0.708$

### 3.3

All Precious =  $18/25 = 0,72$

All Recall =  $18/25 = 0.72$

Micro F1-score = 0.72

### 3.4

Macro F1-score  $\approx 0.718$

### 3.5

Small number of samples.

Many samples in data set belong to a certain class, not evenly distributed.

Classifier has different performance with different class.
